## Section 1

MANE 3332.03

## Lecture 19, April 3

- Topics:
  - Chapter 5: CLT
  - Chapter 6: Multivariate Statistical Analysis
  - Chapter 7: Definitions
  - Chapter 8: Interval Estimation
- Assignments:
  - Technical Report One due today
  - Linear Combination Practice Problems due today
  - Linear Combination Quiz (assigned 4/3/25, due 4/8/25)
- Attendance
- Questions?

## Handouts

- Chapter 5
  - Chapter 5 Slides
  - Chapter 5 Slides marked
- Chapter 6
  - Chapter 6 Slides
  - Chapter 6 Slides marked

- Final Exam Handouts

#### Class Schedule

Tuesday Lecture	Thursday Lecture
4/1: Chapter 5	4/3: Chapters 7 & 8
4/8: Chapter 8, Case 1	4/10: Chapter 8, Case 2
4/15: Chapter 8, Case 3	4/17: Chapter 9, Case 1
4/22: Chapter 9, Case 2	4/24: Chapter 9, Case 3
4/29: Chapter 11	5/1: Chapter 11
5/6: Review	5/8: Dead Day (no class)

10 Sessions plus final exam

Final Exam: Tuesday May 13, 2025 10:15 am - 12:00 pm

#### Chapter 8 Introduction

- Intervals are another method of performing estimation
- A confidence interval is an interval estimate on a population parameter (primary focus of this chapter)
- Three types of interval estimates
  - A confidence intervals bounds population or distribution parameters
  - A tolerance interval bounds a selected proportion of a distribution
  - A prediction interval bounds future observations from the population or distribution
- Interval estimates, especially confidence intervals are commonly used in science and engineering

# Confidence Interval on the Mean of a normal distribution, variance known (Case 1)

- Suppose that  $X_1, X_2, \ldots, X_n$  is a random sample from a normal population with unknown mean  $\mu$  and known variance  $\sigma^2$
- A general expression for a confidence interval is

$$P[L \le \mu \le U] = 1 - \alpha$$

• Using the sample results we calculate a  $100(1-\alpha)\%$  confidence of the form

$$1 \le \mu \le u$$

• A  $100(1-\alpha)\%$  confidence interval for the mean of a normal distribution with variance known is

## Problem 8-12, part a (6th edition)

- 8-12. The life in hours of a 75-watt light bulb is known to be normally distributed with  $\sigma=25$  hours. A random sample of 20 bulbs has a mean life of  $\bar{x}=1014$  hours.
- (a) Construct a 95% two-sided confidence interval on the mean life.
- (b) Construct a 95% lower-confidence bound on the mean life.

Figure 2: image

## Interpreting Confidence Intervals

Montgomery gives the following statement regarding the correct interpretation of confidence intervals.

The correct interpretation lies in the realization that a CI is a random interval because in the probability statement defining the end-points of the interval, L and U are random variables. Consequently, the correct interpretation of a  $100(1-\alpha)\%$  CI depends on the relative frequency view of probability. Specifically, if an infinite number of random samples are collected and a  $100(1-\alpha)\%$  confidence interval for  $\mu$  is computed from each sample,  $100(1-\alpha)\%$  of these intervals will contain the true value of  $\mu$ .

#### One-sided Confidence Bounds

It is possible to construct on-sided confidence bounds

• A  $100(1-\alpha)\%$  upper-confidence bound for  $\mu$  is

$$\mu \le u = \bar{x} + z_{\alpha} \frac{\sigma}{\sqrt{n}}$$

• A  $100(1-\alpha)\%$  lower-confidence bound for  $\mu$  is

$$\bar{x} - z_{\alpha} \frac{\sigma}{\sqrt{n}} = l \le \mu$$

## Sample Size Considerations

If  $\bar{x}$  is used as an estimate of  $\mu$ , we can be  $100(1-\alpha)\%$  confident that the error  $|\bar{x}-\mu|$  will not exceed a specified amount E when the sample size is

$$n = \left(\frac{z_{\alpha/2}\sigma}{E}\right)^2$$

## Problem 8–12,part b (6th edition)

- 8-12. The life in hours of a 75-watt light bulb is known to be normally distributed with  $\sigma=25$  hours. A random sample of 20 bulbs has a mean life of  $\bar{x}=1014$  hours.
- (a) Construct a 95% two-sided confidence interval on the mean life.
- (b) Construct a 95% lower-confidence bound on the mean life.

Figure 3: image

## A Large Sample CI for $\mu$

- When n is large (say greater than or equal to 40), the central limit theorem can be used
- It states that  $\frac{\bar{x} \mu}{\sigma / \sqrt{n}}$  is approximately a standard normal random variable.
- Thus, we can replace the quantity  $\sigma/\sqrt{n}$  with  $S/\sqrt{n}$  and still use the quantiles of the normal distribution to construct a confidence interval.

$$\bar{x} - z_{\alpha/2} \frac{s}{\sqrt{n}} \le \mu \le \bar{x} + z_{\alpha/2} \frac{s}{\sqrt{n}}$$

• What assumption did we relax and why?

Chapter 8, Case 1 Practice Problems

# Confidence Interval for the mean of Normal distribution with variance unknown (Case 2)

#### The t distribution

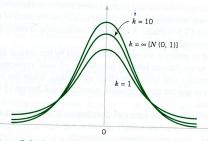

Definition.

Let  $X_1, X_2, \ldots, X_n$  be a random sample from a normal distribution with unknown mean  $\mu$  and unknown variance  $\sigma^2$ . The random variable

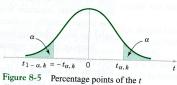

$$T = \frac{\overline{X} - \mu}{S/\sqrt{n}}$$

has a t distribution with n-1 degrees of freedom.

- A table of percentage points (quantiles) is given in Appendix A Table 5
- Figure 8-4 on page 180 shows the relationship between the t and normal distributions.
- Figure 8-5 explains the percentage points of the t distribution

Probability density functions of several tdistributions.

distribution.

Figure 4: image

#### Confidence interval definition

• Using the t distribution it is possible to construct CIs If  $\bar{x}$  and s are the mean and standard deviation of a random sample from a normal distribution with unknown variance  $\sigma^2$ , a  $100(1-\alpha)\%$  confidence interval on  $\mu$  is given by

$$\bar{x} - t_{\alpha/2, n-1} \frac{s}{\sqrt{n}} \le \mu \le \bar{x} + t_{\alpha/2, n-1} \frac{s}{\sqrt{n}}$$

where  $t_{\alpha/2,n-1}$  is the upper  $100(\alpha/2)$  percentage point of the t distribution with n-1 degrees of freedom.

## Problem 8-30 (6th edition)

(February 1988, p. 33) describes several characteristics of fuel rods used in a reactor owned by an electric utility in Norway. Measurements on the percentage of enrichment of 12 rods were reported as follows:

2.94	3.00	2.90	2.75	3.00	2.95
2.90	2.75	2.95	2.82	2.81	3.05

- (a) Use a normal probability plot to check the normality assumption.
- (b) Find a 99% two-sided confidence interval on the mean percentage of enrichment. Are you comfortable with the statement that the mean percentage of enrichment is 2.95 percent? Why?

Figure 5: image

 $\nu$  = degrees of freedom.

#### One-sided confidence bounds

- Are easy to construct
- Use only the appropriate upper or lower bound
- Change  $t_{\alpha/2,n-1}$  to  $t_{\alpha,n-1}$

Chapter 8, Case 2 Practice Problems

# Confidence Interval for $\sigma^2$ and $\sigma$ (Case 3)

- Section 8-3 presents a CI for  $\sigma^2$  or  $\sigma$
- Requires the  $\chi^2$  (chi-squared) distribution

Let  $X_1, X_2, \ldots, X_n$  be a random sample from a normal distribution with mean  $\mu$  and variance  $\sigma^2$  and let  $S^2$  be the sample variance. Then the random variable

$$\chi^2 = \frac{(n-1)S^2}{\sigma^2}$$

has a chi-square  $(\chi^2)$  distribution with n-1 degrees of freedom

- $\bullet$  A table of the upper percentage points of the  $\chi^2$  distribution are given in Table 4 in the appendix
- $\bullet$  Figure 8-9 on page 183 explains the percentage points of the  $\chi^2$  distribution

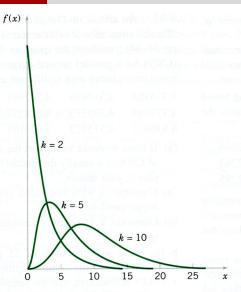

Figure 8-8 Probability density functions of several  $\chi^2$  distributions.

Figure 7: image

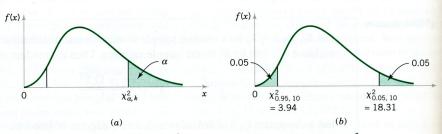

Figure 8-9 Percentage point of the  $\chi^2$  distribution. (a) The percentage point  $\chi^2_{\alpha,k}$ . (b) The upper percentage point  $\chi^2_{0.05,10} = 18.31$  and the lower percentage point  $\chi^2_{0.95,10} = 3.94$ .

Figure 8: image

#### Confidence Intervals for $\sigma^2$ and $\sigma$

If  $s^2$  is the sample variance from a random sample of n observations from a normal distribution with unknown variance  $\sigma^2$ , then a  $100(1-\alpha)\%$  confidence interval on  $\sigma^2$  is

$$\frac{(n-1)s^2}{\chi^2_{\alpha/2,n-1}} \le \sigma^2 \le \frac{(n-1)s^2}{\chi^2_{1-\alpha/2,n-1}}$$

where  $\chi^2_{\alpha/2,n-1}$  and  $\chi^2_{1-\alpha/2,n-1}$  are the upper and lower  $100\alpha/2$  percentage points of the  $\chi^2$ -distribution with n-1 degrees of freedom

## Problem 8-36 (6th edition)

 $\sqrt{8-36}$ . The sugar content of the syrup in canned peaches normally distributed. A random sample of n=10 cans yield a sample standard deviation of s=4.8 milligrams. Find 95% two-sided confidence interval for  $\sigma$ .

v = degrees of freedom.

#### One-sided confidence bounds

- Are easy to construct
- Use only the appropriate upper or lower bound
- Change  $\chi^2_{\alpha/2,n-1}$  to  $\chi^2_{\alpha,n-1}$  or  $\chi^2_{1-\alpha/2,n-1}$  to  $\chi^2_{1-\alpha,n-1}$
- See eqn (8-20) on page 184

Chapter 8, Case 3 Practice Problems

## Large-Sample CI for a Population Proportion (Case 4)

- Recall from chapter 4, that the sampling distribution of  $\widehat{P}$  is approximately normal with mean p and variance p(1-p)/p, if n is not too close to either 0 or 1 and if n is relatively large.
- Typically, we require both  $np \ge 5$  and  $n(1-p) \ge 5$

f n is large, the distribution of

$$Z = \frac{X - np}{\sqrt{np(1-p)}} = \frac{\widehat{P} - p}{\sqrt{\frac{p(1-p)}{n}}}$$

is approximately standard normal.

If  $\hat{p}$  is the proportion of observations in a random sample of size n that belongs to a class of interest, an approximate  $100(1-\alpha)\%$  confidence interval on the proportion p of the population that belongs to this class is

$$\hat{p} - z_{\alpha/2} \sqrt{\frac{\hat{p}(1-\hat{p})}{n}} \le p \le \hat{p} + z_{\alpha/2} \sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$$

where  $z_{\alpha/2}$  is the upper  $\alpha/2$  percentage point of the standard normal distribution

#### Other Considerations

• We can select a sample so that we are  $100(1-\alpha)\%$  confident that error  $E=|p-\widehat{P}|$  using

$$n = \left(\frac{z_{\alpha/2}}{E}\right)^2 p(1-p)$$

An upper bound on is given by

$$n = \left(\frac{z_{\alpha/2}}{E}\right)^2 (0.25)$$

• One-sided confidence bounds are given in eqn (8-26) on page 187

#### Guidelines for Constructing Confidence Intervals

• Review excellent guide given in Table 8-1

#### Other Interval Estimates

- When we want to predict the value of a single value in the future, a prediction interval is used
- A **tolerance interval** captures  $100(1-\alpha)\%$  of observations from a distribution

#### Prediction Interval for a Normal Distribution

- Excellent discussion on pages 189 190
- A  $100(1-\alpha)\%$  PI on a single future observation from a normal distribution is given by

•

$$\bar{x} - t_{\alpha/2, n-1} s \sqrt{1 + \frac{1}{n}} \le X_{n+1} \le \bar{x} + t_{\alpha/2, n-1} s \sqrt{1 + \frac{1}{n}}$$

#### Tolerance Intervals for a Normal Distribution

• A **tolerance interval** to contain at least  $\gamma\%$  of the values in a normal population with confidence level  $100(1-\alpha)\%$  is

$$\bar{x} - ks, \bar{x} + ks$$

where k is a tolerance interval factor for the normal distribution found in appendix A Table XII. Values are given for  $1 - \alpha = 0.9$ , 0.95 and 0.99 confidence levels and for  $\gamma = .90$ , .95, and .99% probability of coverage

 One-sided tolerance bounds can also be computed. The factors are also in Table XII
