

Lecture 17, March 31

Agenda

- Midterm not graded: still contacting students who missed exam
- Continue working on Technical Report One Assignment
- Chapter Six
- Attendance
- Questions?

Schedule

Monday Lecture	Wednesday Lecture
3/31: Chapter 6	4/2: Chapter 5
4/7: Chapter 7 & 8	4/9: Chapter 8, Case 1
4/14: Chapter 8: Case 2	4/16: Chapter 8: Case 3
4/21: Chapter 9, case 1	4/23: Chapter 9, Case 2
4/28: Chpater 9, Case 3 5/5: Chapter 11	4/30: Chapter 11 $5/7$: Review

12 classroom sessions plus Final Exam

MANE 3332.04

Handouts

- Chapter 6 Slides
- Chapter 6 Slides marked

Numerical Summaries

- Called Descriptive Statistics in Chapter 6
 - Descriptive statistics help us understand the location or central tendency of data and the scatter or variability in data
 - Included in all statistical software packages, R does a good job calculating descriptive statistics

Central Tendency

- Ostle, et. al. (1996) define central tendency as "the tendency of sample data to cluster about a particular numerical value"
- Population mean

$$\mu = \frac{1}{N} \sum_{i=1}^{N} x_i$$

• Sample mean

$$\bar{x} = \hat{\mu} = \frac{1}{n} \sum_{i=1}^{n} x_i$$

- Sample median middle value
- Sample mode most commonly occuring number(s)

Measures of Variability

- There are several statistics that measure the variability or spread present in data
- Population variance

$$\sigma^2 = \frac{\sum_{i=1}^{N} (x_i - \mu)^2}{N}$$

Sample variance

$$s^2 = \hat{\sigma}^2 = \frac{\sum_{i=1}^{n} (x_i - \bar{x})^2}{n-1}$$

• Shortcut (Computational) Formula

$$s^{2} = \frac{\sum_{i=1}^{n} x_{i}^{2} - \frac{\left(\sum_{i=1}^{n} x_{i}\right)^{2}}{n}}{n-1}$$

 Standard deviation is often used because it is measured in the original units

Calculating Quantiles

Chapter 2 Descriptive Statistics and Graphical Displays

2.3.2 Sample Quantiles

In Example 2.8, we consider an ogive for the plated bracket data. The point (1.55, 0.567) is on that ogive, so we estimate that 56.7% of the sampled population of brackets weighted at most 1.55 ounces. Weights associated with other percentages can also be estimated by locating the appropriate point on the ogive. In general, if the point (x, p) is on the ogive, we can use x as an estimate of the weight with 100p% of the population values at or below it. This estimate, called the 100pth sample quantile is denoted.

This estimate, called the 100pth sample quantile, is denoted x_p .

If two persons (or computer programs) use different groupings to obtain an ogive, the resulting quantiles will differ. To remedy this deficiency, an algebraic procedure is required.

THE 100pth SAMPLE QUANTILE

Several definitions of sample quantiles are used. We use the one that agrees with the default values output by the UNIVARIATE procedure in SAS*. Also, the definition used here is consistent with our definition of the sample median.

Suppose a sample of size n is obtained from some population associated with a continuous variable. For 0 , let <math>p(n+1) = i + d, with i the integer part of p(n+1) and $0 \le d < 1$ the decimal part. If $1 \le i < n$, and d = 0, the 100pth sample quantile is $x_{i(j)}$. If $1 \le i < n$ and 0 < d < 1, interpolate linearly between $x_{(i)}$ and $x_{(i+1)}$. In either case, the 100pth sample quantile i > 1.

$$x_p = x_{(i)} + d[x_{(i+1)} - x_{(i)}]$$
 (2.4)

when $1 \le i < n$. If i = 0 or n, the 100pth sample quantile does not exist. If 100p is an integer, the corresponding quantile is called a *percentile*.

EXAMPLE 2.18

Suppose we want to find the 43rd percentile of

there are n = 75 observations in the sample and p = 0.43, we find p(n + 1) = (0.43)(75 + 1) = 32.68. Letting i = 32 and d = 0.68, we use Equation (2.4) to obtain $x_{0.43} = x_{(3.2)} + (0.68)(x_{(3.3)} - x_{(3.2)})$. The 32nd ordered value in Figure 2.1(b) is $x_{(3.2)} = 1.50$ and the 33rd ordered value is $x_{(3.3)} = 1.51$. Thus, the 43rd percentile for these data is $x_{(4.4)} = 1.50$ + (0.68)(1.51 - 1.50) = 1.5068 \times 1.507. Using this as a point estimate of the population percentile, we can say that approximately 43% of the plated brackets produced on the day the data were collected had weights of 1.507 ounces or less.

The Sample Median is a Percentile Suppose we want to find the 50th percentile and the data set contains n values. When n is even, (0.50)(n+1)=(n/2)+(0.50), with n/2 a positive integer. Using Equation (2.4) with i=n/2 and d=0.50, $x_{0.50}=x_{0.7}+(0.50)$ $\{x_{(i+1)}-x_{(i)}\}=\{x_{(i)}+x_{(i+1)}\}/2$. When n is odd, (0.50)(n+1)=(n+1)/2, with (n+1)/2 a positive integer. Using Equation (2.4) with i=(n+1)/2 and d=0, we find $x_{0.50}=x_{(i)}$. But, this is precisely how the sample median was defined. Thus, $x=x_{0.50}$.

SAMPLE GUARTILES

The percentiles $x_{0.25}$, $x_{0.50}$, and $x_{0.75}$ are known as the *first*, *second*, and *third sample quartiles*, respectively. These quantities are often denoted q_1 , q_2 , and q_3 .

EXAMPLE 2.19

Consider the plated bracket weights in Table 2.1. Using the ordered stem-and-leaf display presented in Figure 2.1(b), we find the following.

- (a) First Quartile: Since (0.25)(75 + 1) = 19, $q_1 = x_{0.25} = x_{(19)} = 1.46$.
- (b) Second Quartile (Median): Since (0.50)(75 ± 1) = 39

Quantile Example

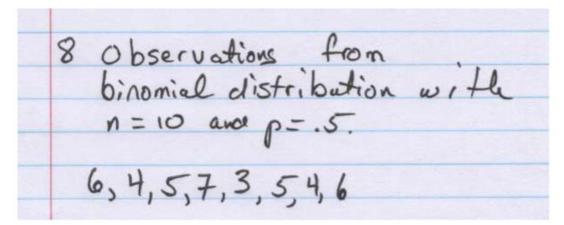

Figure 6: Quantile Example

Exploratory Data (Graphical) Analysis

- Exploratory data analysis (EDA) is the use of graphical procedures to analyze data.
- John Tukey was a pioneer in this field and invented several of the procedures
- Tools include stem-and-leaf diagrams, box plots, time series plots and digidot plots

MANE 3332.04

Stem and Leaf Diagram

- Excellent tool that maintains data integrity
- The stem is the leading digit or digits
- The leaf is the remaining digit
- Make sure to include units
- R Code

stem(midterm\$MidtermExam)

Stem and Leaf Example

• R output of a Stem and Leaf diagram

The decimal point is 1 digit(s) to the right of the I

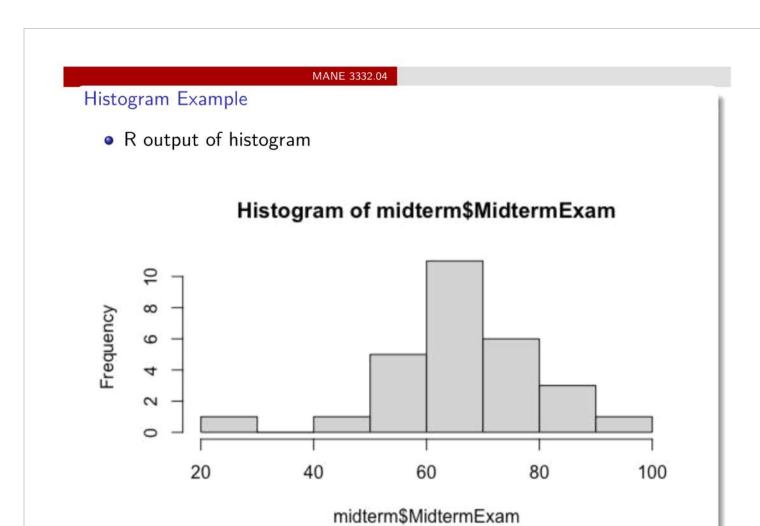

- 2 | 8
- 3 1
- 4 | 4

- 7 | 2247
- 8 | 00147
- 9 1 2

Figure 7: Stem and Leaf Plot of Midterm Exam Scores

Histogram

- A histogram is a barchart displaying the frequency distribution information
- There are three types of histograms: frequency, relative frequency and cumulative relative frequency
- R code

hist(midterm\$MidtermExam)

Boxplot

- Graphical display that simultaneously describes several important features of a data set such as center, spread, departure from symmetry and outliers
- Requires the calculation of quantiles (quartiles)

Box Plot 1

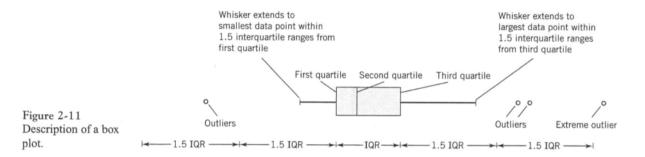

Figure 9: Box plot with explanation

Box Plot 2

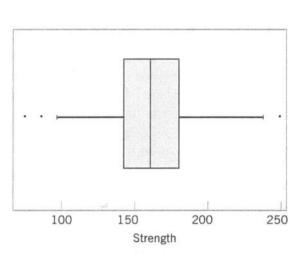

Figure 2-12 Box plot for compressive strength data in Table 2-2.

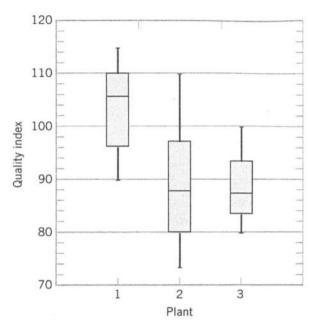

Figure 2-13 Comparative box plots of a quality index at three plants.

Box Plot 3

• R code for Box Plot

boxplot(midterm\$MidtermExam,xlab='Score',main='Boxplot of Midt

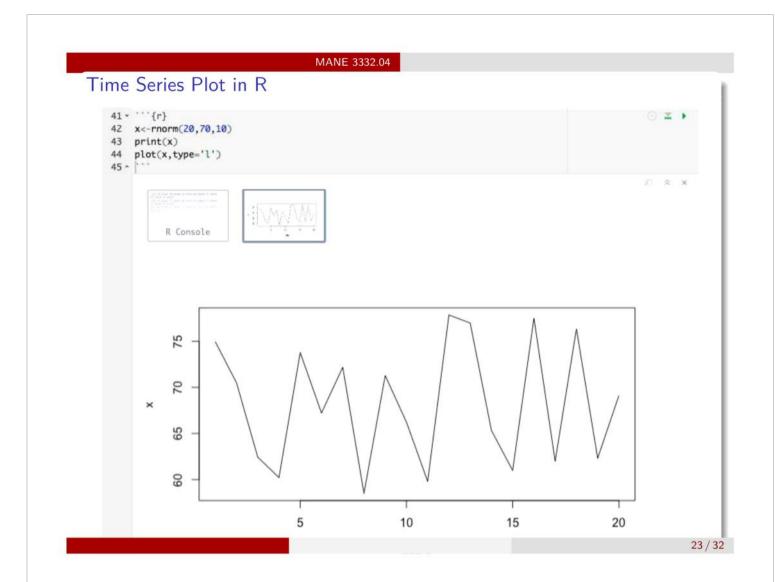

R Box Plot output

Boxplot of Midterm Exam Scores

Time Series Plot

- A **time series plot** is a graph in which the vertical axis denotes the observed value of the variable (say x) and the horizontal axis denotes time
- Excellent tool for detecting:
 - trends,
 - cycles,
 - other non-random patterns

Probability Plotting

- **Probability plotting** is a graphical method of determining whether sample data conform to a hypothesized distribution
- Used for validating assumptions
- Alternative to hypothesis testing

Construction

Sort the data from smallest to largest, .

$$X_{(1)}, X_{(2)}, \ldots, X_{(n)}$$

2 Calculate the observed cumulative frequency (j-0.5)/n For the normal distribution find z_j that satisfies

$$\frac{j-0.5}{n} = P(Z \le z_j) = \Phi(z_j)$$

1 Plot z_j versus $x_{(j)}$ on special graph paper

Usage

• If the data plots as a straight line, the assumed distribution is correct

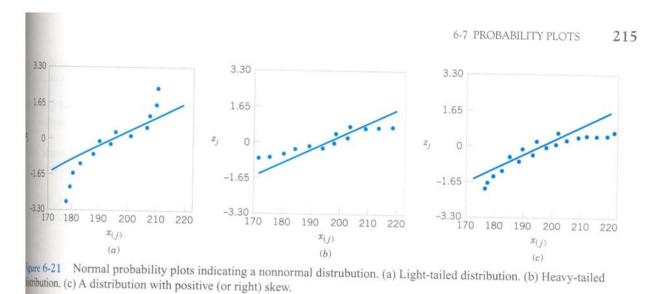

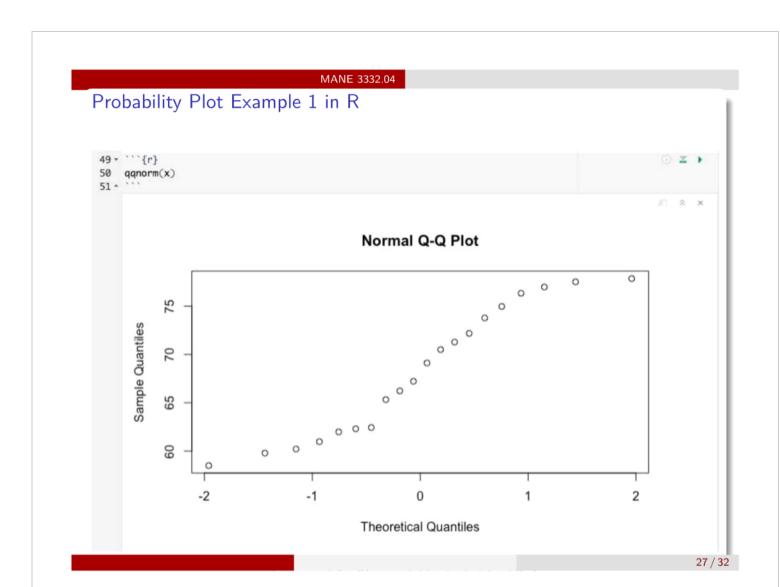

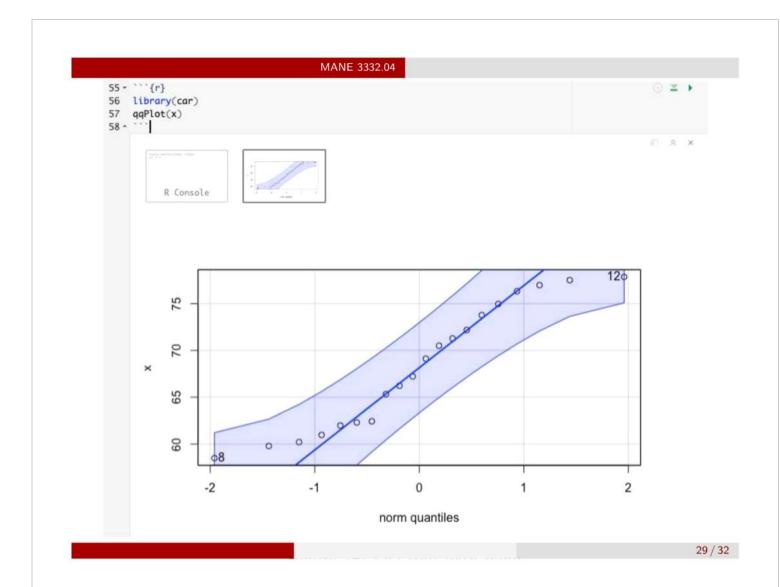

Figure 13: normal probability plots from textbook, figure 6.21 on page 215

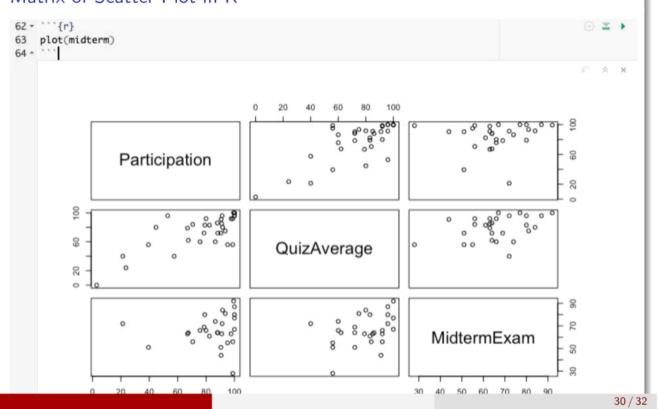

Probability Plot Example 2

- Difficulty from example one is how close to straight is "good enough"
- Add confidence bands to normal probability plot
 - Requires package car to be added to R
 - If all points are within the band, we are 95% confident that the sample is from a normal distribution. However if one or more points are not within band, the data is not from a normal distribution
