Attandance 1-13

MANE 3332.05

LECTURE 18

Agenda

- Midterm exams are not graded; still contacting students who missed
- Linear Combination Practice Problems (assigned 10/28, due 10/30)
- Linea Combination Quiz (assigned 10/30, due 11/4)
- Complete Chapter Six and Start Chapter 7
- Attendance
- Questions?

Handouts

- Lecture 18 Slides
- Lecture 18 Slides marked

CHAPTER 6, CONTINUED

Calculating Quantiles

Let pz.10 Fird x suchtlet P(x<x)=.1

For distributions: std normal,

2.3.2 Sample Quantiles

In Example 2.8, we consider an opies for the plated bracket data. The paint (1.55, 0.687) is on that opies, so we are consistent of the constraint of the constraint with one of the constraint with other percentages can also be estimated to the opies, and one of the copies, we can use as an estimate of the weight with the copies, we can use as an estimate of the weight with 1.00pts of the population values as to below it. This estimate, called the 100pts nample quantities, is denoted to the copies, we

If two persons (or computer programs) use different groupings to obtain an ogive, the resulting quantiles will differ. To remedy this deficiency, an algebraic procedure is required.

THE 100pth SAMPLE QUANTILE

Several definitions of sample quantiles are used. We use the one that agrees with the default values output by the UNIVARIATE procedure in SAS*. Also, the definition used feriniston used median.

Suppose a sample of size n is obtained from one population associated with a continuous variable. For 0 , let <math>p(n + 1) p : 1 + d, with i the integer part of p(n + 1) and 0 < d < 1 in the decimal part $1! 1 \le i < n$, and d = 0, the 100pth sample quantile is x_{ij} . If $1 \le i < n$ and 0 < d < 1, interpolate linearly between x_{ij} and $x_{ij} < 1$, 1 is either case, the 100pth sample quantile is $x_{ij} < 1$ in either case, the

$x_p = x_{(i)} + d[x_{(i+1)} - x_{(i)}]$ (2.4)

when $1 \le i < n$. If i = 0 or n, the 100pth sample quantile does not exist. If 100p is an integer, the corresponding quantile is called a *percentile*.

EXAMPLE 8.18

Suppose we want to find the 43rd percentile of the sample of plated weights in Table 2.1. Since there are n=75 observations in the sample and p=0.43, with $q_1p+1 = (0.43, 5)q+1 = (0.43, 5)q+1 = 3.268$. Letting i=32 and d=0.68, we use Equation (2.4) to Osbita $r_{0.03} \approx r_{0.03} \approx r_$

The Sample Medion is a Percential Suppose was sut to find the 50th percentile and the data set contains π value. When n is $e = (0.50)^n + 1 - 1 - (0.62)^n$ a positive integer. Using Equation (2.4) with a = n/2 and $a = (0.50)^n \times_{N/2} = \frac{n}{2} (n + 0.00)$ $(s_{N/2}) = \frac{n}{2} (n + 0.00)$ But, this is precisely how the sample median was defined. Thus, $z = s_{N/2}$

SAMPLE QUARTILES

The percentiles $x_{0.25}$, $x_{0.50}$, and $x_{0.75}$ are known as the first, second, and third sample quartiles, respectively. These quantities are often denoted q_1 , q_2 , and q_3 .

EXAMPLE 8.10

Consider the plated bracket weights in Table 2.1. Using the ordered stem-and-leaf display presented in Figure 2.1(b), we find the following.

- (a) First Quartile: Since (0.25)(75 + 1) = 19 $q_1 = x_{0.25} = x_{(19)} = 1.46$. (b) Second Quartile (Median): Since (0.50)(75 + 1) = 38
- Since (0.50)(75 + 1) = 38, $q_2 = \bar{x} = x_{0.50} = x_{(38)} = 1.53$.

=1, d=00

2 × p = Xc.) +0[Xcinj-Xci]

reference for calculating quantiles

X(i) is the 1th ranked observation

Quantile Example

$$P = .25^{-}$$
 $N = 8$
 $P(n+1) = .25(81)$
 $= 2.25$
 $2 = 2.25$
 $2 = 2.25$

Exploratory Data (Graphical) Analysis

- Exploratory data analysis (EDA) is the use of graphical procedures to analyze data.
- John Tukey was a pioneer in this field and invented several of the procedures
- Tools include stem-and-leaf diagrams, box plots, time series plots and digidot plots

Stem and Leaf Diagram

- Excellent tool that maintains data integrity
- The stem is the leading digit or digits
- The leaf is the remaining digit
- Make sure to include units
- R Code

```
stem (midterm$MidtermExam)
```

Stem and Leaf Example

R output of a Stem and Leaf diagram

Stem and Leaf Plot of Midterm Exam Scores

Histogram

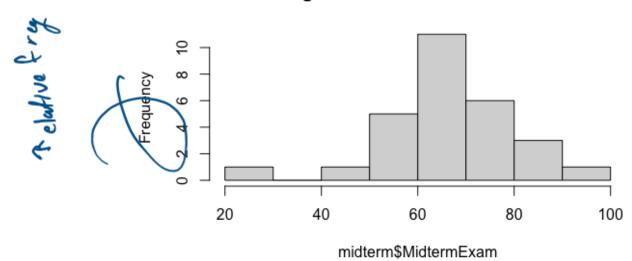

- A histogram is a barchart displaying the frequency distribution information
- There are three types of histograms: frequency, relative frequency and cumulative relative frequency
- R code

```
hist(midterm$MidtermExam)
```

Time Series Plot

- A **time series plot** is a graph in which the vertical axis denotes the observed value of the variable (say x) and the horizontal axis denotes time
- Excellent tool for detecting:
 - trends,
 - cycles,
 - other non-random patterns

& Moi kdown

R comme

Time Series Plot in R

Time Series Plot

Probability Plotting

- Probability plotting is a graphical method of determining whether sample data conform to a hypothesized distribution
- Used for validating assumptions
- Alternative to hypothesis testing

Construction

- 1. Sort the data from smallest to largest, .
- 2. $x_{(1)}, x_{(2)}, ..., x_{(n)}$
- 3. Calculate the observed cumulative frequency (j-0.5)/n

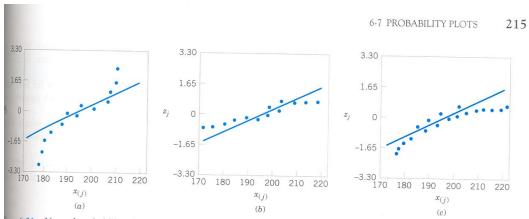

For the normal distribution find z_i that satisfies

$$\frac{j-0.5}{n} = P(Z \le z_j) = \Phi(z_j)$$

3. Plot z_i versus $x_{(i)}$ on special graph paper

Usage

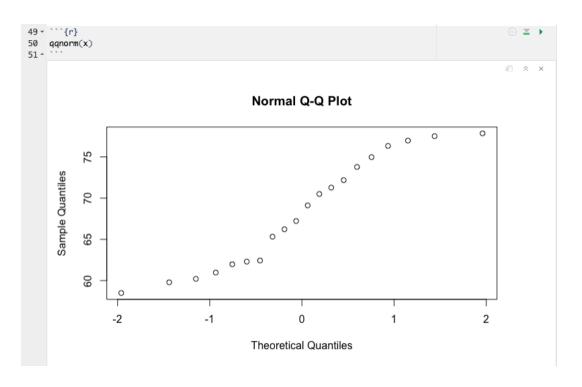

If the data plots as a straight line, the assumed distribution is correct

yure 6-21 Normal probability plots indicating a nonnormal distribution. (a) Light-tailed distribution. (b) Heavy-tailed stribution with positive (or right) skew.

normal probability plots from textbook, figure 6.21 on page 215

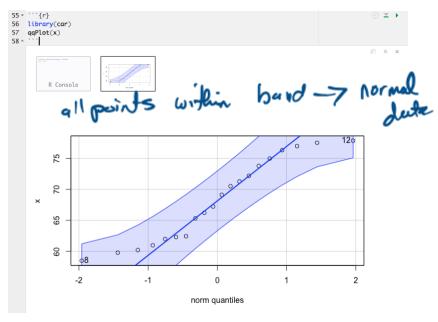

Probability Plot Example 1 in R

Normal Probability Plot

Probability Plot Example 2

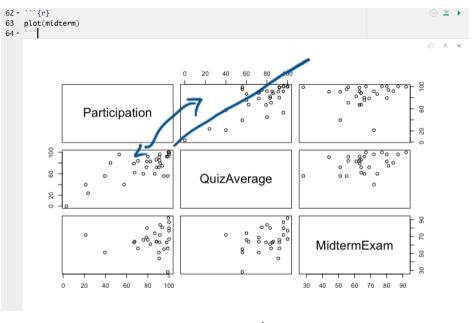

- Difficulty from example one is how close to straight is "good enough"
- Add confidence bands to normal probability plot
 - Requires package car to be added to R
 - If all points are within the band, we are 95% confident that the sample is from a normal distribution. However if one or more points are not within band, the data is not from a normal distribution

Correlation Matrix

Chapter 7 Overview

- Chapter 7 contains a detailed explanation of point estimates for parameters
- Much of this chapter is of a highly statistical nature and will not be covered in this course
- Key concepts we will discuss are:
 - Statistical inference
 - Statistic
 - Sampling distribution
 - Point estimator
 - Unbiased estimate
 - MVUE estimator
 - Central limit theorem
 - Sampling distributions

Statistical Inference

Montgomery gives the following description of statistical inference.

The field of statistical inference consists of those methods used to make decisions or to draw conclusions about a population. There methods utilize the information contained in a sample from the population in drawing conclusions. This chapter begins our study of the statistical methods used for inference and decision making.

 Statistical inference may be divided into two major areas: parameter estimation and hypothesis testing

Point Estimate

- Montgomery states that "In practice, the engineer will use sample data to compute a number that is in some sense a reasonable value (or guess) of the true mean. This number is called a point estimate."
- Discuss examples
- A formal definition of a point estimate is

A **point estimate** of some population parameter θ is a single numerical value $\hat{\theta}$ of a statistic $\hat{\theta}$. The statistic $\hat{\theta}$ is called the point estimate.

Notice the use of the "hat" notation to denote a point estimate

Statistic $x = \frac{1}{2} \sum_{i=1}^{n} x_i$

- Point estimate requires a sample of random observations, say X_1, X_2, \dots, X_n
- Any function of the sampled random variables is called a statistic
- The function of the random variables is itself a random variable
- Thus, the sample mean \bar{x} and the sample variance s^2 are both statistics and random variables

Properties of point estimators

- We would like point estimates to be both accurate and precise
- An unbiased estimator addresses the accuracy criteria
- A minimum variance unbiased estimator addresses the precision criteria

Unbiased Estimator

• The point estimator $\widehat{\Theta}$ is an **unbiased estimator** for the parameter θ if

$$E(\widehat{\Theta}) = \theta$$

• If the point estimator is not unbiased, then the difference $E(\widehat{\Theta}) - \theta$

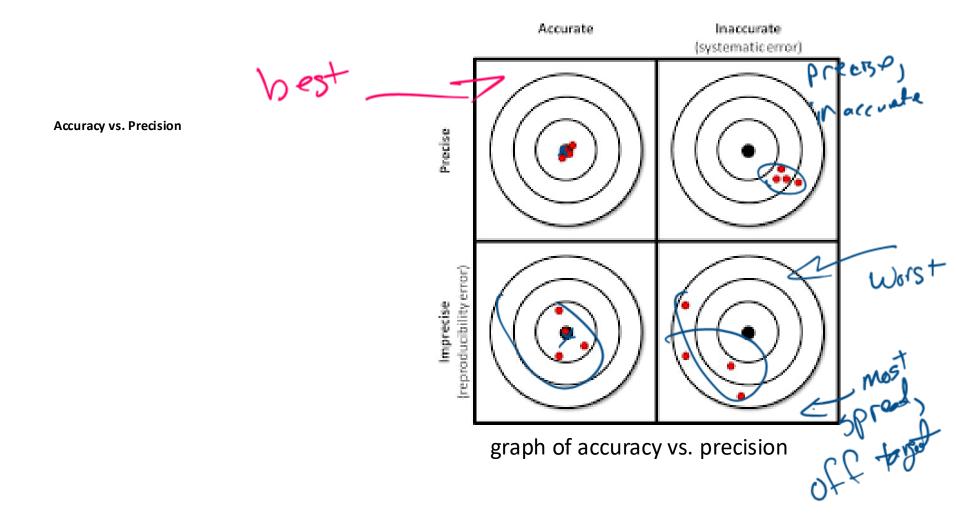

is called the **bias** of the estimator
$$\widehat{\Theta}$$

MVUE

Montgomery gives the following definition of a minimum variance unbiased estimator (MVUE)

If we consider all unbiased estimators of θ , the one with the smallest variance is called the minimum variance unbiased estimator

• An import fact is that the sample mean \bar{x} is the MVUE for μ when the data comes from a normal distribution

Sampling Distribution

The probability distribution of a statistic is called a sampling distribution

Central Limit Theorem

Definition of the Central Limit Theorem is

If X_1, X_2, \ldots, X_n is a random sample of size n taken from a population (either finite or infinite) with mean μ and finite variance σ^2 , and if X is the sample mean, the limiting form of the distribution of

$$Z = \frac{X - \mu}{\sigma / \sqrt{r}}$$
as $n \to \infty$, is the standard normal distribution

- Important result because for sufficiently large n, the sampling distribution of X is normally distribution
- This is a fundamental result that will be used extensively in the next four chapters of the textbook.
