

**MANE 3351**

# **LECTURE 2**

# Classroom Management

## Agenda

- Questions
- Review 1st day
- Introduction to Python
- Discuss lab today

**Much of the lecture 2 material is a demonstration. Later in the course, we will learn these techniques.**

## GitHub Desktop

The screenshot shows the GitHub Desktop download page in a web browser. The address bar displays <https://desktop.github.com/download/>. The page has a dark theme. At the top, the GitHub Desktop logo is visible. Below it, there are two main download buttons: "Download for Apple Silicon" and "Download for Intel chip". Further down, there are two sections: "Beta" and "Windows". The "Beta" section includes a link to "Check out Beta" and text about experiencing the latest features and bug fixes. The "Windows" section includes a link to "Download for Windows" and text about needing to download the installer. At the bottom, there is a footer that says "By downloading, you agree to the Open Source Applications Terms."

## Python with Jupyter Notebook

- Standard Normal Case 1

```
import matplotlib.pyplot as plt
import numpy as np
import scipy.stats as sct
import math
```

```
a=0.5
```

```
x=np.linspace(-4,4,500)
y=sct.norm.pdf(x,0,1)
y2=0.0*x
maske =(x<a)
```

```
plt.plot(x,y,'b')
plt.fill_between(x,y,color='#666666',where=maske)
plt.plot(x,y2,'b')
plt.show()
```

```
answer=sct.norm.cdf(a,0,1)
print ("%8.6f" % (answer))
```

## **Methods for Acquiring Python Code**

1. Clone repository to local machine using GitHub Desktop
2. Copy code from MANE 3351 Fall 2025 Public Repository
3. Copy code from lecture notes

## Comments about Python Installation

- We will utilize Anaconda python that is pre-installed on lab computers
  - Discuss installing on personal computers
- Dr. Timmer will utilize a conda environment so that configure for MANE 3351 is stored separately and doesn't possible corrupt other environments
- Most of the time, Dr. Timmer will work from the command line on a Mac
- Quick demonstration on both Mac and Windows

## First 4 Lines

- Imports allow external packages to be used
- Most standard packages are included in the Anaconda installation
  - **Matplotlib** “is a Python 2D plotting library which produces publication quality figures in a variety of hardcopy formats and interactive environments across platforms. Matplotlib can be used in Python scripts, the Python and IPython shells, the Jupyter notebook, web application servers, and four graphical user interface toolkits”
  - **NumPy** “is the fundamental package for scientific computing with Python. It contains amongst other things: 1). a powerful N-dimensional array object, 2). sophisticated (broadcasting) functions, 3. tools for integrating C/C++ and Fortran code, and 4). useful linear algebra, Fourier transform, and random number capabilities.”
  - **SciPy** “is a Python-based ecosystem of open-source software for mathematics, science, and engineering. In particular, these are some of the core packages: NumPy, SciPy library, Matplotlib, IPython, Sympy, and pandas.”
  - **Math** “provides access to the mathematical functions defined by the C standard.”

## Numpy Linspace

The screenshot shows the NumPy API reference page for `numpy.linspace`. The left sidebar lists various NumPy modules, with `numpy.linspace` highlighted. The main content area displays the function signature and description. Handwritten annotations in red and blue ink are present: "Required" with an arrow pointing to the `start` and `stop` parameters; "Order is important" in blue at the top right; "optional arguments with defaults" with an arrow pointing to the `num`, `endpoint`, and `retstep` parameters; and "[source]" pointing to the source link. The function signature is `numpy.linspace(start, stop, num=50, endpoint=True, retstep=False, dtype=None, axis=0, *, device=None)`. The description states: "Return evenly spaced numbers over a specified interval. Returns `num` evenly spaced samples, calculated over the interval `[start, stop]`. The endpoint of the interval can optionally be excluded." Two version change notes are shown: "Changed in version 1.16.0: Non-scalar `start` and `stop` are now supported." and "Changed in version 1.20.0: Values are rounded towards `-inf` instead of `0` when an integer `dtype` is specified. The old behavior can still be obtained with `np.linspace(start, stop, num).astype(int)`". The "Parameters:" section lists `start` and `stop` as `array_like` types, with descriptions of their roles in the sequence.

NumPy reference > ... > Array creation routines > `numpy.linspace`

### `numpy.linspace`

`numpy.linspace(start, stop, num=50, endpoint=True, retstep=False, dtype=None, axis=0, *, device=None)` [\[source\]](#)

Return evenly spaced numbers over a specified interval.

Returns `num` evenly spaced samples, calculated over the interval `[start, stop]`.

The endpoint of the interval can optionally be excluded.

**Changed in version 1.16.0:** Non-scalar `start` and `stop` are now supported.

**Changed in version 1.20.0:** Values are rounded towards `-inf` instead of `0` when an integer `dtype` is specified. The old behavior can still be obtained with `np.linspace(start, stop, num).astype(int)`

**Parameters:**

**start** : `array_like`

The starting value of the sequence.

**stop** : `array_like`

The end value of the sequence, unless `endpoint` is set to False. In that case, the sequence consists of all but the last of `num + 1` evenly spaced samples, so that `stop` is excluded. Note that the step size changes when `endpoint` is False.

## scipy.stats.norm

**norm** = `<scipy.stats._continuous_distns.norm_gen object>` [\[source\]](#)

A normal continuous random variable.

The location (`loc`) keyword specifies the mean. The scale (`scale`) keyword specifies the standard deviation.

As an instance of the `rv_continuous` class, `norm` object inherits from it a collection of generic methods (see below for the full list), and completes them with details specific for this particular distribution.

### Methods

<code>rvs(loc=0, scale=1, size=1, random_state=None)</code>	Random variates.
<code>pdf(x, loc=0, scale=1)</code>	Probability density function.
<code>logpdf(x, loc=0, scale=1)</code>	Log of the probability density function.
<code>cdf(x, loc=0, scale=1)</code>	Cumulative distribution function.

## Pyplot tutorial

An introduction to the pyplot interface. Please also see [Quick start guide](#) for an overview of how Matplotlib works and [Matplotlib Application Interfaces \(APIs\)](#) for an explanation of the trade-offs between the supported user APIs.

### Introduction to pyplot

`matplotlib.pyplot` is a collection of functions that make matplotlib work like MATLAB. Each `pyplot` function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc.
